SDEWES 2015, Dubrovnik, 02.10.2015

Overview

- ▶ The past trends and driving factors of the emissions
- ▶ Limiting the global warming
- ▶ Mitigation measures and policies
- ▶ Prerequisites for effective mitigation
- ▶ Paris 2015: Latest developments
- ▶ Will we make it?

The past trends and driving factors of the emissions

A yellow bulldozer is shown from a high angle, working on a large pile of dark, granular material, likely coal or ore. The bulldozer is positioned on the right side of the frame, with its front loader bucket raised. The material is piled up in a large, irregular shape, and the bulldozer appears to be pushing or spreading it. The background is a vast, flat expanse of the same material, stretching towards the horizon. The overall scene is industrial and suggests a mining or construction operation.

**GHG emissions growth has accelerated
despite reduction efforts.**

GHG emissions growth between 2000 and 2010 has been larger than in the previous three decades.

Based on Figure SPM.1

About half of the cumulative anthropogenic CO₂ emissions between 1750 and 2010 have occurred in the last 40 years.

Based on Figure 5.3

Regional patterns of GHG emissions are shifting along with changes in the world economy.

GHG Emissions by Country Group and Economic Sector

Based on Figure 1.6

GHG emissions rise with growth in GDP and population.

Based on Figure SPM.3

The long-standing trend of decarbonization has reversed.

Based on Figure SPM.3

Limiting the global warming

**Limiting warming involves substantial technological,
economic and institutional challenges.**

Without additional mitigation, global mean surface temperature is projected to increase by 3.7 to 4.8°C over the 21st century.

Based on WGII AR5 Figure 19.4

Stabilization of atmospheric GHG concentrations requires moving away from business as usual.

Lower ambition mitigation goals require similar reductions of GHG emissions.

Mitigation involves substantial upscaling of low-carbon energy.

Based on Figure SPM.4

Mitigation involves substantial upscaling of low-carbon energy.

Based on Figure SPM.4

Many scenarios make it at least *about as likely as not* that warming will remain below 2°C relative to pre-industrial levels.

Before 2030

GHG Emissions Pathways [GtCO₂eq/yr]

“Immediate Action”

Based on Figure SPM.5

Still, between 2030 and 2050, emissions would have to be reduced at an unprecedented rate...

Based on Figure SPM.5

...implying a rapid scale-up of low-carbon energy.

Before 2030

GHG Emissions Pathways [GtCO₂eq/yr]

After 2030

Rate of CO₂ Emission Change [%/yr]

Share of Low-Carbon Energy [%]

Based on Figure SPM.5

Delaying emissions reductions increases the difficulty and narrows the options for mitigation.

Before 2030

GHG Emissions Pathways [GtCO₂eq/yr]

“Delayed Mitigation”

“Immediate Action”

Based on Figure SPM.5

Delaying emissions reductions increases the difficulty and narrows the options for mitigation.

Before 2030

GHG Emissions Pathways [GtCO₂eq/yr]

After 2030

Rate of CO₂ Emission Change [%/yr]

Share of Low-Carbon Energy [%]

Based on Figure SPM.5

Delaying emissions reductions increases the difficulty and narrows the options for mitigation.

Mitigation measures and policies

An aerial, high-angle photograph of a complex industrial facility, likely a refinery or chemical plant. The image is dominated by a dense network of silver-colored metal pipes, valves, and structural steel frameworks. In the center-left, a worker wearing a bright yellow protective suit and a white hard hat is walking across a metal walkway. To the right, a large, horizontal cylindrical storage tank is visible. The overall scene is industrial and intricate, with various components like flanges, elbows, and support beams creating a complex geometric pattern. The lighting is somewhat dim, and the image has a slightly desaturated, blue-tinted appearance.

Low stabilization scenarios depend on a full decarbonization of energy supply.

Baseline scenarios suggest rising GHG emissions in all sectors, except for CO₂ emissions from the land-use sector.

Based on Figure TS.15

Mitigation requires changes throughout the economy. Systemic approaches are expected to be most effective.

450 ppm CO₂eq with Carbon Dioxide Capture and Storage

Based on Figure TS.17

Mitigation efforts in one sector determine efforts in others.

450 ppm CO₂eq without Carbon Dioxide Capture and Storage

Based on Figure TS.17

Decarbonization of energy supply is a key requirement for limiting warming to 2°C.

Based on Figure 7.11

Energy demand reductions can provide flexibility, hedge against risks, avoid lock-in and provide co-benefits.

Based on Figure 7.11

Reducing energy demand through efficiency enhancements and behavioural changes is a key mitigation strategy.

Based on Figure SPM.8

Reducing energy demand through efficiency enhancements and behavioural changes are a key mitigation strategy.

Based on Figure SPM.8

An aerial photograph of an offshore wind turbine in the ocean. A large service vessel is positioned directly beneath the turbine's tower, likely performing maintenance or construction. The scene is captured in a blue-tinted, low-light environment, possibly at dawn or dusk. The text is overlaid in the center of the image.

The wide-scale application of best-practice low-GHG technologies could lead to substantial emission reductions.

Examples from electricity generation: Low emission technologies exist, but emissions are reduced to different degrees.

Based on Figure 7.7

Due to cost decline, renewable energy technologies are becoming economical solutions in an increasing number of countries.

Based on Figure 7.7

Growth of Wind and Photovoltaics

Grid parity in 102 countries

An aerial view of a large container ship sailing on the ocean. The ship is white with a red hull and is heavily loaded with colorful shipping containers (blue, red, yellow, and white) stacked high on its deck. The ship is moving towards the bottom left of the frame, leaving a white wake behind it. The ocean is a deep blue with some whitecaps. The text "Mitigation cost estimates vary, but global GDP growth may not be strongly affected." is overlaid in white, bold, sans-serif font across the middle of the image.

Mitigation cost estimates vary, but global GDP growth may not be strongly affected.

Global costs rise with the ambition of the mitigation goal.

Based on Table SPM.2

Technological limitations can increase mitigation costs.

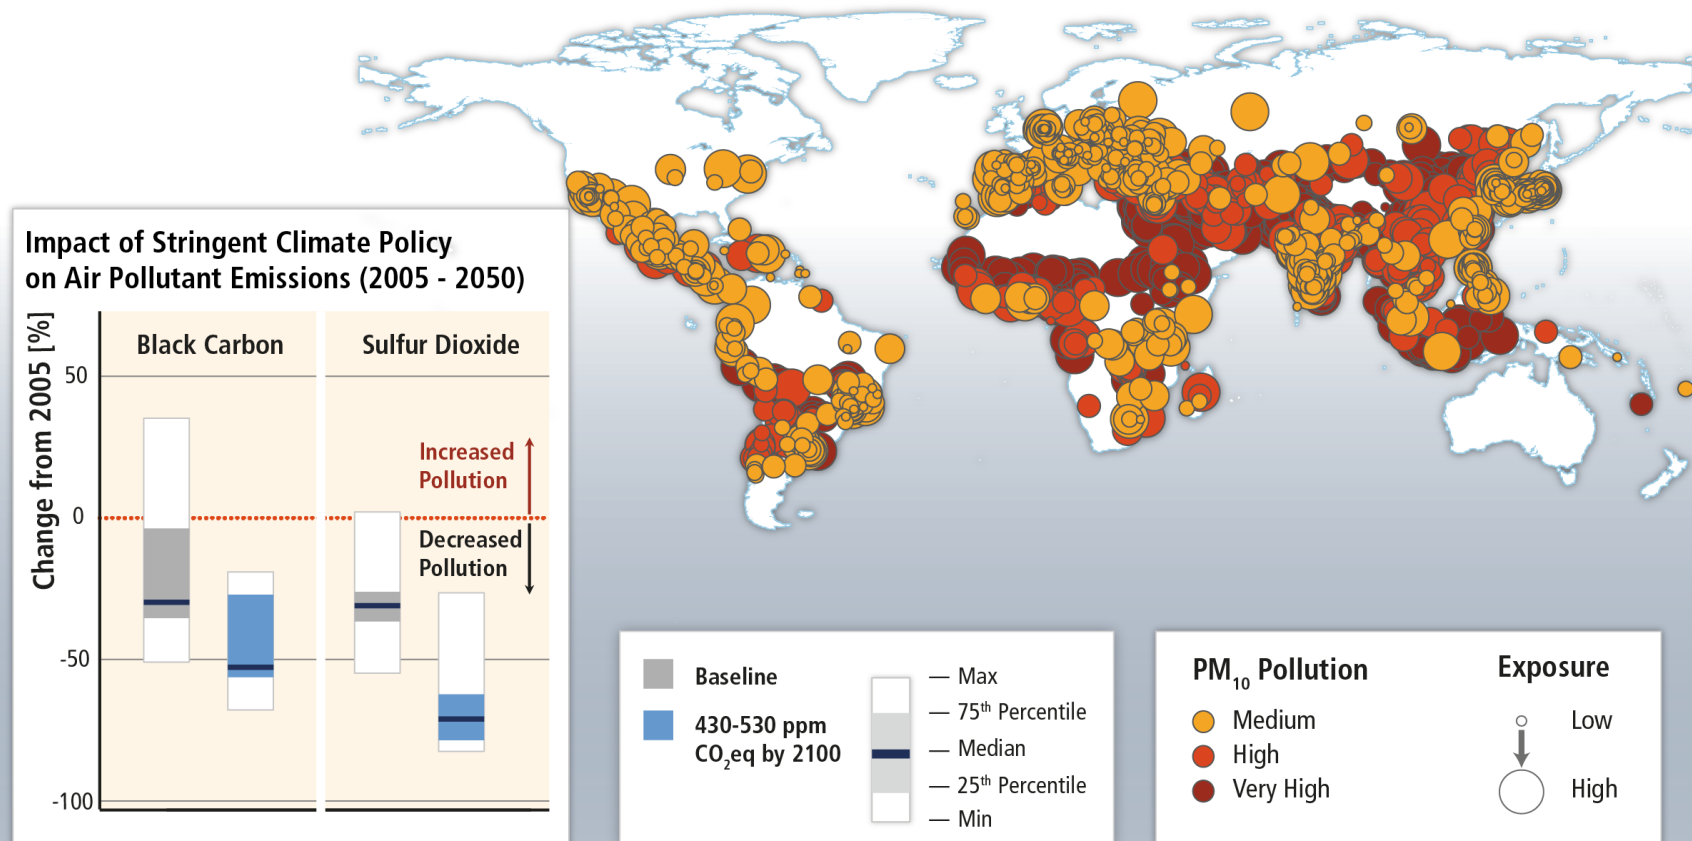

Based on Figure 6.24

Mitigation can result in co-benefits for human health and other societal goals.

Based on Figures SPM.6 and 12.23

Climate change mitigation can result in co-benefits for human health and other societal goals.

Based on Figures SPM.6 and 12.23

Average employment over life of facility
(Jobs per megawatt of average capacity)

	Manufacturing, construction, instalation	Operating & maintenance/ fuel processing	Total
Solar PV	5.76-6.21	1.20-4.80	6.96-11.01
Wind power	0.43-2.51	0.27	0.70-2.78
Biomass	0.40	0.38-2.44	0.78-2.84
Coal-fired	0.27	0.74	1.01
Natural gas-fired	0.25	0.70	0.95

Note: Based on findings from a range of studies published in 2001-04. Assumed capacity factor is 21% for solar PV, 35% for wind, 80% for coal, and 85% for biomass and natural gas.

**Table 8: Average employment over life of facility
(jobs per megawatt of average capacity)**

Prerequisites for effective mitigation

Changes in investment patterns and appropriate policies

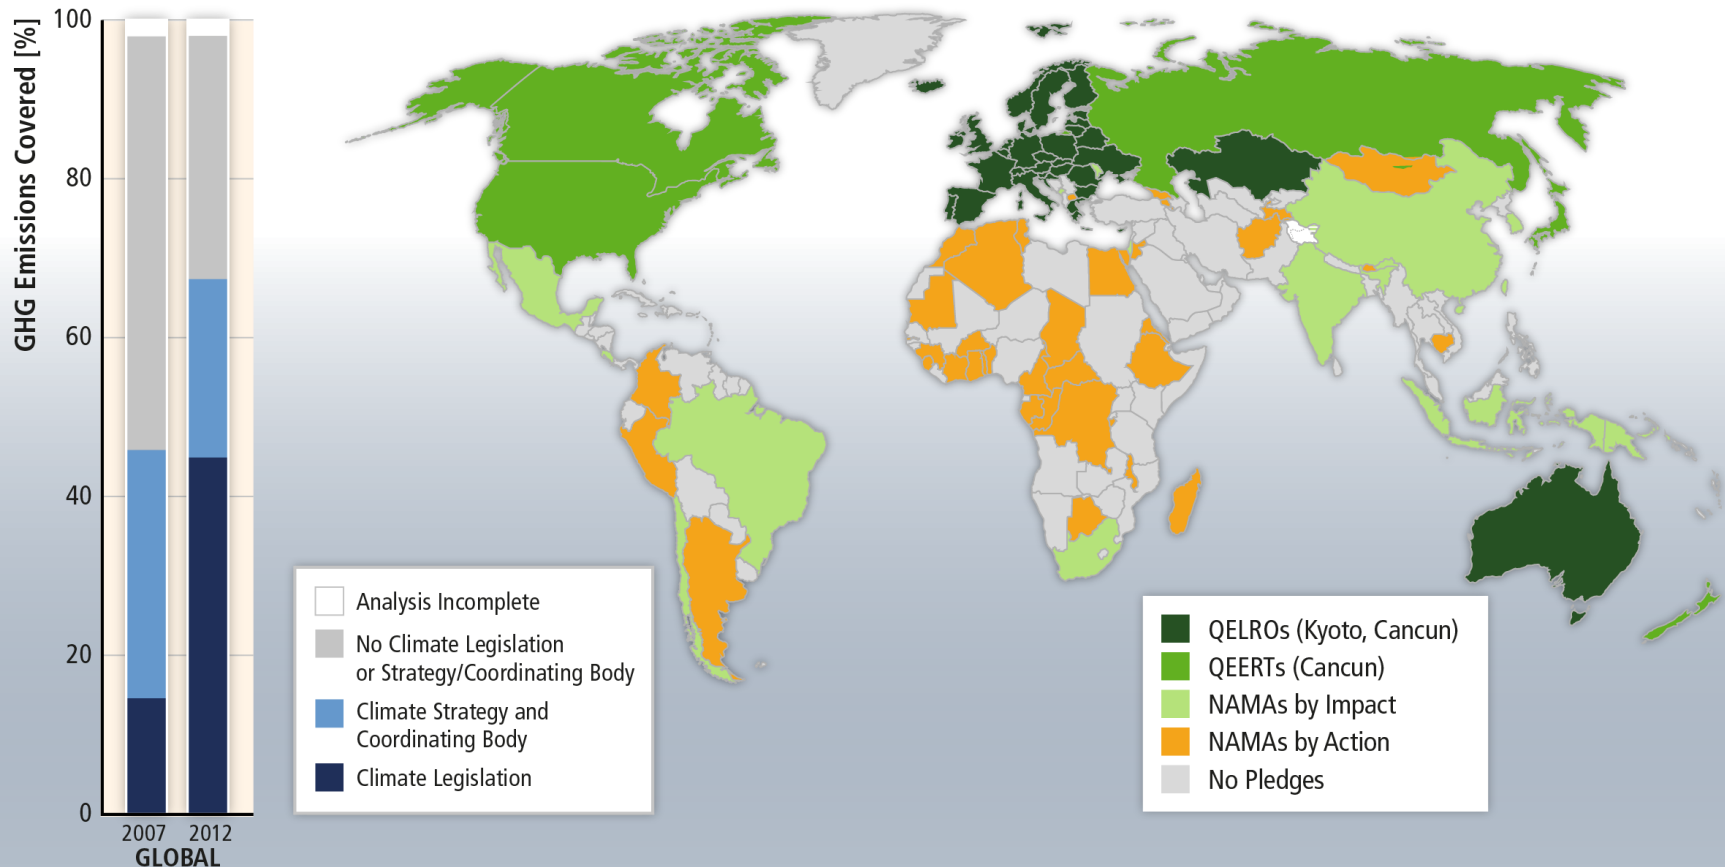

Substantial reductions in emissions require significant changes in investment patterns.

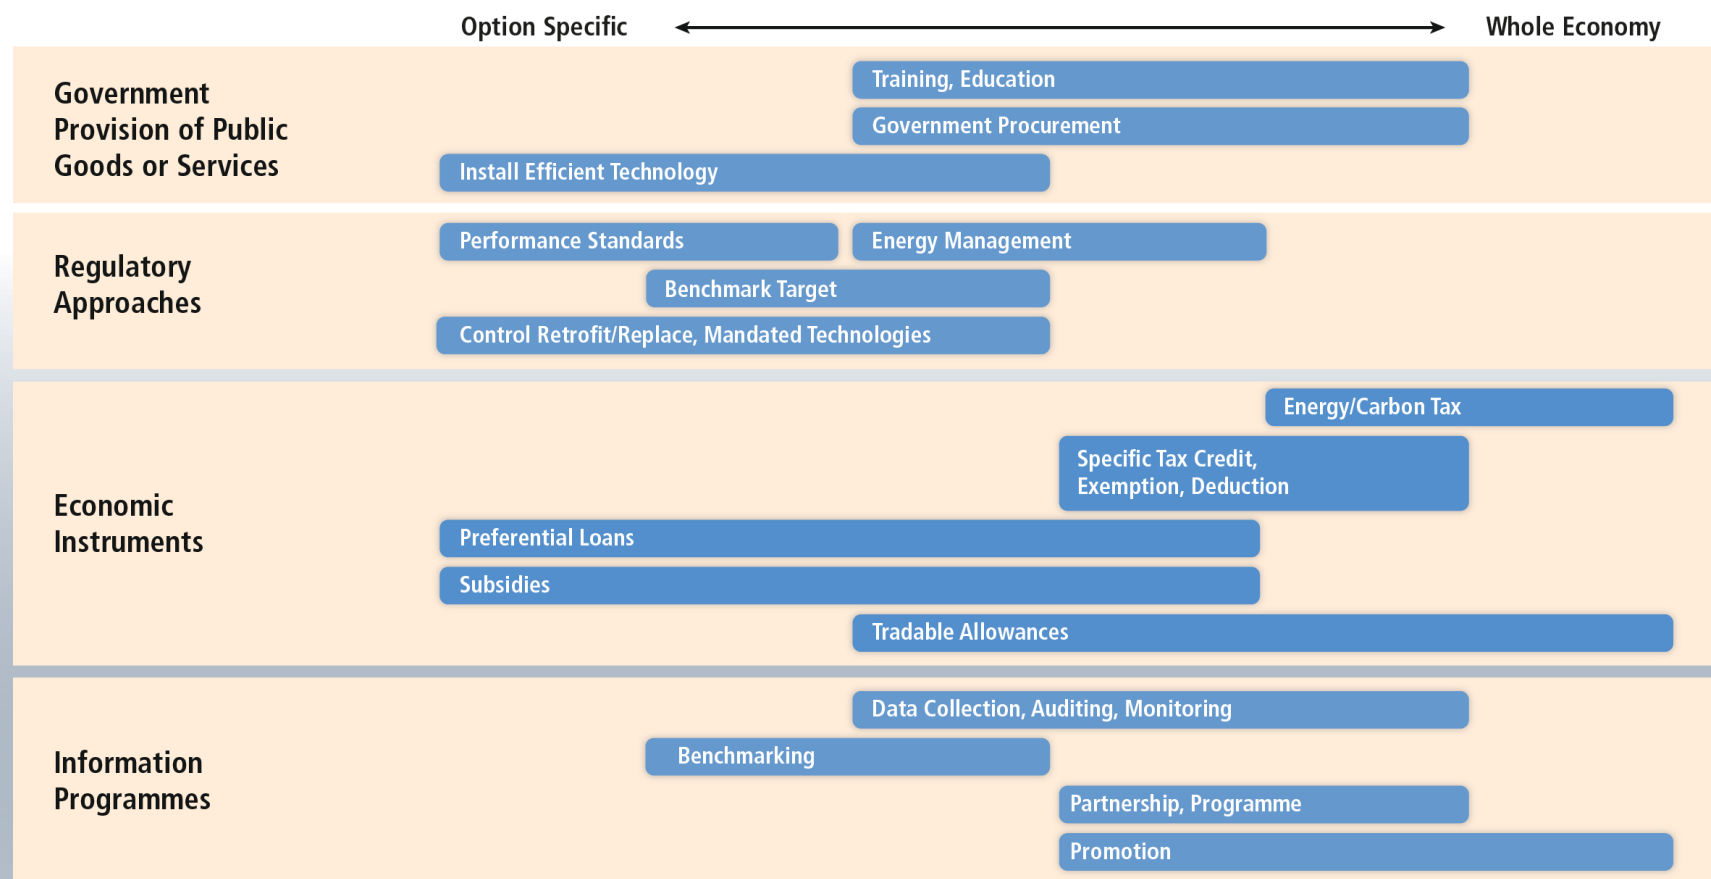

Based on Figure SPM.9

There has been a considerable increase in national and sub-national mitigation policies since AR4.

Based on Figures 15.1 and 13.3

Sector-specific policies have been more widely used than economy-wide policies.

Based on Figure 10.15

**Science for technology advancement and
informed policy design**

GREAT TIME FOR

SCIENTISTS !!!

Hot topics

- ▶ Better integration of wind and solar
- ▶ Integration of power, heating, cooling, water and transport systems
- ▶ Market arbitrage (time delay, power-heat, power-water, demand management, power-fuels)
- ▶ Solution for road freight, shipping, aviation and high temperature processes - biomass + synthetic fuels?
- ▶ Quantification of socioeconomic impacts of mitigation measures and policies

International cooperation across scales

Based on Figure 13.1

Latest developments

(UNFCCC - INDC portal, 1 Oct 2015)

- ▶ Submitted INDCs: 120
- ▶ Parties represented: 148
- ▶ Global GHG emissions % covered by Parties which already submitted: over 85%
- ▶ Expected GHG variation compared to 1990 with the submitted INDCs: +19% (source: Factor CO2, No.4, Sept 2015)

Latest developments

- ▶ European Union: At least -40% (vs 1990)
- ▶ Mexico: -22% (vs BAU)
- ▶ USA: -26%/-28% (vs 2005) in 2025
- ▶ Russia: -25%/-30% (vs 1990)
- ▶ Canada: -30% (vs 2005)
- ▶ Morocco: -13% (vs BAU)
- ▶ China: -60%/-65% per unit of GDP (vs 2005)
- ▶ Republic of Korea -37% (vs BAU)
- ▶ Macedonia: -36% (vs BAU)
- ▶ Australia: -26%/-28% (vs 2005)

Latest developments

- ▶ The commitments made, and likely to be made by December, will not by themselves be enough to achieve the 2 degrees goal.
- ▶ Approaches for bolstering these targets:
 - ▶ Engaging “non-state actors” (cities, local governments and businesses);
 - ▶ INDCs should be subject to regular review and ratcheting up in the years after the Paris meeting.
- ▶ Sorting out the finance part of the deal remains a burning issue.
- ▶ There is dispute over a number of issues such as “loss and damage”.
- ▶ Questions still hovered over what would appear in the core agreement.

Will we make it?

- ▶ The idea of success might seem as a long shot, but the present actions bring hope that all the individual agents will advance their interests coherently towards the common goal of saving the planet.

Will we make it?

The role of science:

- ▶ To assess the risks and options;
- ▶ To innovate technologies and devise new solutions;
- ▶ In a rigours and policy-neutral way, to inform the processes for reaching decisions.
